IT/Technology

Cover Letter

As an IT enthusiast, I aspire to delve deeply into the field of web development: directly creating websites, UI/UX design, integrating interesting and diverse features, and so on. Although I am studying business administration at university, my primary focus is on programming.

At this stage, accumulating knowledge and experience is extremely important to me. Therefore, I want to gain insights from experienced professionals and engage in complex tasks.

I'm interested in the involvement of various professionals in the website creation process, task execution, communication with them and even leading a web development project. Since the most websites are built on WordPress engine and it's much easier and faster to complete web projects, I am also eager to learn WordPress Development.

It would be ideal if I had the opportunity to engage in other disciplines of web development as well.

Why the DevsData internship program? - I believe that working on large-scale projects and tackling challenging assignments under the supervision of professionals will provide me with the skills I need. In the future, I will be able to implement ambitious projects myself.

I enjoy having an impact on the final customer satisfaction. It would be very satisfying if the website I create simplifies access to financial services for people.

My motivation comes from a strong desire to deepen my knowledge!
